

# What's good for the heart is good for the brain

Things you can do to help reduce your risk of dementia

There are things you can do to reduce your own risk of developing dementia. These include keeping active, eating healthily, and exercising your mind. Your lifestyle has a profound impact on your brain health.

Dementia risk is lowest in people who have healthy behaviours in mid-life (aged 40–65). The younger you start the better, so start as early as possible!

## Diabetes

Research shows that type 2 diabetes increases a person's risk of developing dementia. Dementia risk also increases with the length of time someone has diabetes and how severe it is.

However, it is important to note that diabetes is only a risk factor and does not mean that a person with diabetes will go on to develop dementia. In people with type 1 diabetes, severe blood sugar highs and lows are also associated with increased risk of developing dementia

## Did you know?

- Diabetes is a risk factor for both Alzheimer's disease and vascular dementia.
- It is also a known risk factor for atherosclerosis and stroke, both of which contribute to vascular dementia.
- More recent studies have shown that diabetes also increases your risk of dementia. [medicalnewstoday.com](http://medicalnewstoday.com)
- Sustained exercise in midlife, and possibly later life, protects from dementia, perhaps through decreasing obesity, diabetes, and cardiovascular risk.
- Keeping to a healthy weight will reduce your risk of type 2 diabetes, stroke and heart disease. Alcohol contains hidden calories, so be aware of how much you drink.
